
User manual of RasPy

Release 0.0.1

bibi21000

January 18, 2015

1	Installation	1
1.1	Raspbian	1
1.2	Update packages	1
1.3	Download it	1
1.4	Configure your system	1
1.5	Installation	2
1.6	Run the tests	2
1.7	Start it	2
1.8	Read the doc	2
2	Use it !!	3

Installation

1.1 Raspbian

Install official raspbian from here : <http://www.raspbian.org/>.

Newbies can install it from : <http://www.raspberrypi.org/downloads/>.

Developpers or others can also install it on standard distributions (Ubuntu, Debian, RedHat, ...).

1.2 Update packages

You can now update packages

```
sudo apt-get -y update
sudo apt-get -y dist-upgrade
```

We need to install some packages to download and build RasPy:

```
sudo apt-get -y install build-essential python-dev python-minimal python python2.7-dev python2.7-
sudo apt-get -y install git python-setuptools python-docutils python-pylint
```

And some development librairies for rrdtool (for the logger) :

```
sudo apt-get -y install libcairo2-dev libpango1.0-dev libglib2.0-dev libxml2-dev librrd-dev
```

Some packages need to be removed as new versions are available from eggs :

```
sudo apt-get remove python-zmq libzmq1 libzmq-dev python-nose pylint
```

1.3 Download it

You should now download RasPy using git. You should not download and install RasPy with root user. Ideally, you should create a special user for running RasPy or the pi user. Keep in mind root is baaadddd (Not support for installation as root !!!).

```
git clone https://github.com/bibi21000/RasPy.git
```

1.4 Configure your system

- access rights
- sudo nopasswd

- ...

1.5 Installation

If you want to develop for RasPy, you need to install it in develop mode :

```
sudo make develop
```

Otherwise install it normally ... but not now ;) :

```
sudo make install
```

And be patient ... installation need to compile zmq ... It takes a while ...

If something goes wrong during install or if you want to remove RasPy from you computer, you type :

```
sudo make uninstall
```

If you want to remove dependencies, look at setup.py to get the list and use the following command for every package:

```
sudo pip uninstall package
```

1.6 Run the tests

Check that the SLEEP constant in tests/common.py ist set to 1.0 or 1.5

```
vim tests/common.py
```

You can now check that everything is fine running the tests :

```
make tests
```

If it fails ... run it again :) At last, copy / paste the full screen output and send it to the core team.

1.7 Start it

In the next monthes, you should be abble to start it :

```
make start
```

1.8 Read the doc

- docs/pdf
- docs/html

Use it !!
